

Comprehensive flight tracking and analysis solution built within a business intelligence platform like Power BI. The first image displays the underlying relational data model, featuring a central "flights" fact table that connects to surrounding dimension tables for "cancellations," "airports," and "airline," enabling multidimensional filtering and routing. The second image showcases the resulting interactive dashboard powered by this data, which summarizes an impressive 1 million total flights. It provides a high-level overview of operational performance, revealing that 55.83% of flights were on time, while a significant 42.29% (443K) were delayed and 1.87% (20K) were canceled. The report further drills down into these metrics using clear visualizations, including bar charts detailing the busiest airports and airlines with the highest delay percentages, alongside trend lines tracking monthly performance and a donut chart breaking down the specific reasons for cancellations.
