

These two images demonstrate advanced analytical features within a Power BI report.

The first image showcases an interactive scatter chart (bubble chart) that evaluates the sum of sales against profit margins, utilizing a play axis at the bottom to animate the performance trajectory of different business types—such as Value Added Resellers—through FY2020 Q4 for the "Clothing" category. The second image highlights a "Forecast" view, presenting a highly granular time-series line chart of daily bike sales from 2018 into 2020. Utilizing Power BI's built-in Analytics pane, this visual extends the historical data with a predictive forecasting model, visually represented at the far right by a grey trendline enveloped within an 80% confidence interval to estimate future sales.
